Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The fusion protein may be used to target proteoglycans to a given site, which causes local accumulation of GAG-binding proteins. Therefore the protein may be used as adjuvants for vaccination and in the targeting of chemokines to non-immunogenic tumour cells to enhance cellular antitumour reconses. In addition, the fusion protein can also enhance the half-life of non-GAG binding growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The recombinant fusion protein may be administered to a patient to enhance the biological activity of a GAG-binding protein within the body. The protein also enhances wound healing and may be used to treat rheumatoid arthritis, asthma. Chronic obstructive pulmonary disorder, Lupus, inflammatory bowel disease, psoriasis, osteoarthritis or
                                                                                                                                                                        Gaps
                    The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 221-255 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is part of the surrounding sequence of one of the potential assembly sites in a CD44 exon.
                                                                                                                                                                                                                                                                                                                                                          Surrounding sequence of potential assembly site E15-Rg, in CD44.

                                                                                                                                                                   The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPS are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                        Peptide #1370 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #1311 encoded by probe for measuring breast gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                       genome-derived single exon nucleic acid probes useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .;

such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic acid cate of the human breast, particularly those diseases with polygenic acid of the human breast, particularly those diseases with polygenic acid of the human breast, fibrocystic changes, proliferative inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               breast disease and non-carcinoma tumours.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide #7757 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                           Novel single exon nucleic acid probe used to measuring gene expression in a human breast \boldsymbol{\cdot}
                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

assembly sites in a CD44 exon.

The recombinant fusion protein may be administered to a patient to enhance the biological activity of a GAG-binding protein within the body. The protein also enhances wound healing and may be used to treat rheumatoid arthritis, asthma, chronic obstructive pulmonary disorder, Lupus, inflammatory bowel disease, psoriasis, osteoarthritis or The fusion protein may be used to target proteoglycans to a given site, which causes local accumulation of GAG-binding proteins. Therefore the protein may be used as adjuvants for vaccination and in the targeting of chemokines to non-immunogenic tumour cells to enhance cellular antitumour responses. In addition, the fusion protein can also enhance the half-life
                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Surrounding sequence of potential assembly site V10-Rg, in CD44.
                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for

These sequences represent extensions which are known to be modified in the presence of an enzyme being assayed for, and the reaction mixture formed is then analysed. This method may be used for assaying protein kinases or enzymes which modify the C-terminal end of Ha-RAS protein, such as farnesyl-protein transferase, or carboxy methyl transferase. These peptides are less expensive to synthesise than standard
                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                         Ha-RAS protein; farnesyl-protein kinase; C-terminal; carboxy methyl transferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assay for enzymes that modify peptide chains - using a substrate comprising a ubiquitin-peptide extension contg. a sequence modified by the enzyme
fusion proteins. BS202 cDNA clones and polypeptides are useful for developing products for detecting, diagnosing, staging, preventing or treating diseases or conditions of the breast,

The invention also provides an isolated and/or recombinant nucleic acid or its functional fragment, homologue or derivative, corresponding to a alpha-catenin binding protein. The invention also relates to a novel human zinc finger protein binding with a member of the a-catulin/vinculin family, preferably with a human the field of drug discovery, diagnosis, prognosis and treatment of cancer and neurological discovery. The present sequence is human ANC_2HOI protein zinc finger motif.
                                                                                                                                                                                                                                                                                                                                    Novel recombinant nucleic acids useful for diagnosing, prognosing and/or treating cancer and neurological disorders, corresponds to a protein binding to alpha-catenin protein and with signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

It is used to produce compounds of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          endothelial cell proliferation, using compound
                                                                                                                                                                                                               The present peptide, and its claimed fragment, are derived from residues 402-498 of the human high polymer quininogen L-chain. They are useful in cell adhesion, cancer metastasis or platelet aggregation inhibitors, and in wound, inflammatory disease, arteriosclerosis or glomerular nephritis treating agents. The present peptide was synthesised using a solid phase method, and purified using a YMC-DOS-120A-S15/13 column.
                                                                                        inhibitor - comprises partial amino acid sequence of human high polymer quininogen L chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Light chain of human high molecular weight kininogen fragment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention is related to the coding sequence and protein fragments of a human catenin-binding zinc finger protein. The coding sequence was isolated from a human kidney cDNA library, but is expressed in most human tissue. The sequences provided by the invention can be used in the diagnosis and treatment of cancer and neurological disorders, and in drug screening to identify compounds capable of the same.

oncogenes which are bound by the monoclonal receptors of the invention. The monochoal receptor molecules are immunoglobulins which bind to both (a) a protein ligand and (b) a polypeptide having an amino acid residue sequence containing 7-40 amino acid residues corresponding to a sequence of a portion of the protein, the receptor molecule having been raised to an immunogen containing the polypeptide. High yields of monoclonal receptors can be obtained which bind to or immunoreact with
the invention. High molecular weight kininogen is a 120 kDa gycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Monoclonal receptors to protein, esp. onco-protein ligands - prepd. using a polypeptide corresp. to a portion of the protein aminoacid

Sequences AAY52601-Y52675 represent oncoprotein epitopes used to raise monoclonal antibodies which bind to both the epitopes and the proteins that comprise them. Certain retroviruses are able to cause the formation of solid tumours within a short period of time after infection of the host. Oncogenes, and the oncoproteins they encode, are responsible for the tumorigenic potential of these retroviruses. Retroviral oncogenes are closely related to and are derived from cellular oncogenes, which cencode proteins with mitogenic activity such as growth factors. The invention relates to monoclonal anti-oncoprotein antibodies, and the method used to purify them. The method of the invention may be used for obtaining purified oncoprotein ligands from aqueous solutions. It may be used in this way to detect proteins produced in tumour cells to diagnose cancers caused by retroviruses. It may also be used for the prognostication of foetal development (and other growth states including
                                                                                                                                                                         0;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 11, 2 Sequence 11, 2 Sequence 85, 2

Patent No. 5556744
GENERAL INFORMATION:
APPLICANT: Weiner, David B.
APPLICANT: Weiner, David B.
APPLICANT: Williams, William V.
TITLE OF INVENTION: Methods and Compositions for Diagnosing
TITLE OF INVENTION: and Treating Certain HIV Infected Patients
NUMBER OF SEQUENCES: 197
CORRESPONDENCE ADDRESS:

ADDRESSEE: Howson and Howson
(GTREET: P.O. Box 457, 321 No. 5556744ristown Road
                Patent No. 5917018
GENERAL INFORMATION:
APPLICANT: Th egersen, Hans Christian
APPLICANT: The carsen, Hans Christian
APPLICANT: Etzerodt, Michael
TITLE OF INVENTION: IMPROVED METHOD FOR THE REFOLDING OF
TITLE OF INVENTION: PROTEINS
NUMBER OF SEQUENCES: 58
CORRESPONDENCE ADDRESS:

A; Description: binds dehydroepiandrosterone sulfate, estrone sulfate, oleic acid, choles C; Keywords: liver; steroid binding
Z protein - guinea pig (fragment)
C; Species: Cavia porcellus (guinea pig)
C; Species: Cavia porcellus (guinea pig)
C; Date: 19-Mar-1997 #sequence_revision 24-Mar-1999 #text_change 24-Mar-1999
C; Accession: S23168
B; Nicollier, M.; Roblin, S.; Cypriani, B.; Remy-Martin, J.P.; Adessi, G.L.
Eur. J. Biochem. 205, 1137-1144, 1992
A; Title: Purification and characterization of a binding protein related to the Z class of A; Accession: S23168; MUID:92249319
A; Reference number: S23168
A; Molecule type: protein
A; Residues: 1-12 < NIC>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C;Accession: 847373

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
